                                                                                                                                                                                                                                                                                                                                                 Compl
DISULFID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FUNCTION: C4BP CONTROLS THE CLASSICAL PATHWAY OF COMPLEMENT ACTIVATION. IT BINDS AS A COFACTOR TO C3B/C4B INACTIVATOR (C3BINA), WHICH THEN HYDROLYZES THE COMPLEMENT FRAGMENT C4B. IT ALSO ACCELERATES THE DEGRADATION OF THE C4BC2A COMPLEX (C3 ACCONVERTASE) BY DISSOCIATING THE COMPLEMENT FRAGMENT C2A. ALPHA CHAIN BINDS C4B. IT INTERACTS ALSO WITH ANTICOAGULANT PROTEIN S CHAIN BINDS C4B. IT INTERACTS ALSO WITH ANTICOAGULANT PROTEIN S AND WITH SERMY ANTICIDE COMPONENT.
SUBUNIT: DISULFIDE-LINKED COMPLEX OF C4BP ALPHA AND BETA CHAINS OF 3 POSSIBLE SORTS: A 570 KD COMPLEX OF TALPHA CHAINS AND 1 BETA CHAIN, A 530 KD HOMOHEDTAMER OF ALPHA CHAINS OR A 500 KD COMPLEX OF ALPHA CHAINS OR A 500 KD COMPLEX OF ALPHA CHAINS OR A 500 KD COMPLEX OF ALPHA CHAIN SON AND 1 BETA CHAIN. THE CENTRAL BODY OF THE ALPHA CHAIN HOMOPOLYMER SUPPORTS TENTACLES, EACH WITH THE BINDING STAPE FOR ALPHA CHAIN SON AND THE SUPPORTS TENTACLES, EACH WITH THE BINDING
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SITE FOR C4B AT THE END.
TISSUE SPECIFICITY: CHYLOMICRONS IN THE PLASMA.
TISSUE SPECIFICATY: CHYLOMICRONS IN THE PLASMA.
SIMILARITY: CONTAINS 8 SUSHI (SCR) REPEATS.
SIMILARITY: TO C4BP BETA CHAIN AND TO PIG APOLIPOPROTEIN R.
SIMILARITY: TO C4BP BETA CHAIN AND TO PIG APOLIPOPROTEIN R.
CAUTION: IT IS UNCERTAIN WHETHER MET-1 OR MET-17 IS THE INITIATOR.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               FUNCTION: C48P CONTROLS THE CLASSICAL PATHWAY OF COMPLEMENT ACTIVATION. IT BINDS AS A COFACTOR TO C3B/C4B INACTIVATOR (C3BINA), WHICH THEN HYDROLYZES THE COMPLEMENT FRAGMENT C4B. I ALSO ACCELERATES THE DEGRADATION OF THE C4BC2A COMPLEX (C3 CONVERTASE) BY DISSOCIATING THE COMPLEMENT FRAGMENT C2A. ALPHA CHAIN BINDS C4B. IT INTERACTS ALSO WITH ANTICOAGULANT PROTEIN AND WITH SERUM AMYLOID P COMPONENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SIMILARITY: CONTAINS 8 SUSHI (SCR) REPEATS.

Biochemistry 26:4668-4674(1987).
-i- FUNCTION: C4BP CONTROLS THE CLASSICAL PATHWAY OF COMPLEMENT ACTIVATION. IT BINDS AS A COFACTOR TO C3B/C4B INACTIVATOR (C3BINA), WHICH THEN HYDROLYZES THE COMPLEMENT FRAGMENT C4B. IT ALSO ACCELERATES THE DEGRADATION OF THE C4BC2A COMPLEX (C3 ALSO ACCELERATES THE DEGRADATION OF THE C4BC2A COMPLEX (C3 CONVERTASE) BY DISSOCIATING THE COMPLEMENT FRAGMENT C2A. ALPHA CONVERTASE) BY DISSOCIATING THE COMPLEMENT FRAGMENT C2A. ALPHA CHAIN BINDS C4B. IT INTERACTS ALSO MITH SERUM ANYLOID P COMPONENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       P08607;

FUNCTION: CA(2+)-DEPENDENT RECEPTOR FOR MYELOID CELLS THAT BINDS
TO CARBOHYDRATES ON NEUTROPHILS AND MONOCYTES. MEDIATES THE
INTERACTION OF ACTIVATED ENDOTHELIAL CELLS OR PLATELETS WITH
LEUKOCYTES. THE LIGAND RECOGNIZED IS SIALVI-LEWIS X.
SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SPECIFICITY: EXPRESSED IN ALL TISSUES EXAMINED: SPLEEN,
LUNG, BRAIN, LIVER, HEART, KIDNEY, THYMUS, SMALL INTESTINE.
INDUCTION: ACUTE INFLAMATION (PROBABLY).
SIMILARITY: TO OTHER SELECTINS/LECAMS.
SIMILARITY: CONTAINS 1 C-TYPE LECTIN FAMILY DOMAIN.

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Human complement factor H homolog protein.
Human complement factor H; immunological mechanism; complement reaction;
gene therapy; immune stimulation; haematopoiesis regulation; chemotactic;
tissue growth activity; anti-inflammatory; tumour inhibition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating or screening for cancer, e.g. renal or urogenital cancer by modulating or detecting tumour associated human complement Factor H related antigen, or nucleic acid encoding it Example 6B; Fig 6B; 104pp; English.

This partial protein is found in clone pRRB9FH410 and represents a complement factor H related protein with homology to a region of the human tumour-associated complement factor H (CFH). The detection of this protein and a CFH antigen can be used in screening or for the treatment of renal or urogenital cancer, e.g. bladder, cervical or prostate cancer. Agents that may modulate this antigen could be used in the manufacture of a medicament for the treatment of a tumour cell.
                                                                                                                                                                                                                                                                                                                                                                                                               Y09065 standard; Protein; 578 AA.

The protein can also be used as an antigen for preparing antibodies against the protein. The cDNA can be used as a probe for gene diagnosis and the gene for gene therapy, as well as for large-scale expression of the protein. The protein may also have immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activin/inhibin activity, anti-inflammatory activity, tumour inhibition activity, chemotactic/chemokinetic activity receptor/ligand activity, etc. The protein is identified by the presence of a hydrophobic N-terminal secretory signal region, knowledge of the protein function is not required, as in e.g. methods of expression

This sequence is used in the identification of complement factor H related proteins and antigens from clone prassprey210 (see W39157-W39159). The detection of this protein and a CFH antigen can be used in screening or for the treatment of renal or urogenital cancer, e.g. bladder, cervical or prostate cancer. Agents that may modulate this antigen could be used in the manufacture of a medicament for the treatment of a tumour cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              30-JUN-1998 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  W45899;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         inflammatory responses such as rheumatoid arthritis
Disclosure; Fig 1, 54pp: English.
This is an amino acid sequence of the human soluble complement receptor 1 (sCR1), useful in the treatment of T-cell or B-cell mediated immune responses. It is used to inhibit a T-cell or B-cell-mediated immune response to prevent immune response-mediated tissue rejection and destruction or clearance or inactivation of an expressed protein especially from cells that have been treated by gene therapy to express the protein, e.g. dystrophin. The protein can also be used to inhibit a T-cell or B-cell-mediated inflammatory response,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    an interferon-gamma secretory response, autoimmune response or neurological response, e.g. Alzheimer's or Parkinson's disease or multiple sclerosis. Also the protein can be used to treat systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis, epidermis bullosa or Hashimoto's disease.

In the sequence, x-untranslated region. This has 7 short consensus repeats (CR) of 4 long direct homologous repeats (LHR) (see fig. 10 in patent). Deletion mutants, eg LHR-A for binding of C4b, and LHR-C for C3b binding, be made, and LHR-B and -C can detect CR2 sequences. They are useful in diagnosing and treating immune disorders, and prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                perfusion injury

This sequence comprises three of the four tandem, direct, long this sequence comprises three of the Inogth F allozyme of CR1. LHR-A is homologous repeats of the full-length F allozyme of CR1 of Short absent. Each LHR might represent a single C3b/C4b binding domain, making the receptor multivalent. The LHR's are composed of 7 short consensus repeats of 60-70 residues resembling the SCR's of other C3/C4 binding proteins. The protein and fragments of it having C3b and/or C4b binding activity can be used to treat immune disorders and of C4b binding activity can be used to treat immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       See also Q11642.

The full-length protein, or its specified fragments are used to treat patients with immune disorders or a disorder caused by inappropriate complement activity. The protein is also used to treat thrombotic conditions in humans and animals. See also Q11643.
